AWS Cloud Formation Does Not Support Template Upgrades with Zend Server / RDS Modifications

Applies to:

Zend Server on AWS

Workflow

When you edit templates, refer from changing RDS and Zend Server related configuration.

To modify the MySQL password for Zend Server user, if a must, you can edit *zend_database.ini* on one node, apply the changes to cluster DB - this will break operations with the UI and components. Then, login to MySQL using a client and change the zend user password according to what you changed in *zend_database.ini*.

To modify Admin login password, use the UI or command line tool with the */usr/local/zend/bin/gui_passwd.php* command.

Workaround

If you already modified the above using the template, you will need to delete **ZSSESSID/ZS6SESSID** cookie from your browser, and login again.
