

Zend Server Install / Uninstall Requires 'which' Command (FIXED)

Applies to:

Zend Server 8.x
Linux (Specifically Reported under CentOS 7)
Current [CentOS 7 image for Docker](#)

Fixed in:

Zend Server 9.0

Problem:

When installing Zend Server using the Linux installer, you might get this error:
"Your system doesn't support either dpkg or rpm"

When running uninstall.sh to remove Zend Server, you might get this error:
"/usr/local/zend/bin/uninstall.sh: line 66: which: command not found"

Workaround:

Install **'which'** command and run the installation / uninstall again.

Resolution:

This was resolved in Zend Server 9.0, by removing dependency of **'which'** package from installation scripts.
