

# How To Change Zend Server URL On Event Emails

## Applies To:

Zend Server  
Monitoring Feature

## Summary:

When you access the Zend Server UI with [HTTPS://HOSTNAME:10082/ZendServer](https://hostname:10082/ZendServer), you would probably like to have Monitor Event Emails link back to the HTTPS access (default port **10082**) and not HTTP (default port **10081**).

Configuration of the Zend Monitor GUI URL only allows you to set the Zend Server GUI **HOSTNAME / IP address**, which is then being automatically wrapped by **HTTP://<HOSTNAME>:10081/ZendServer**

## Workaround:

Backup and edit this email template file>

Linux / Mac: `/usr/local/zend/gui/data/email-templates/event.phtml`

Windows: `C:\Program Files (x86)\Zend\ZendServer\gui\data\email-templates\event.phtml`

IBM i: `/usr/local/zendsvr6/gui/data/email-templates/event.phtml`

The original content uses this back link to the event details:

```
<a href='<?php echo $baseUrl . "/Issue?issueId=" . $eventGroup->getIssueId(); ?>'>
```

To make explicit URL prefix, add this line in the beginning of the template file:

```
<?php $baseUrl='https://<hostname>:10082/ZendServer'; ?>
```

**Hint:** If you automate this change on all your Zend Server installation, you can grab the machine <hostname> using PHP, and make this line Generic.

## Result:

This template modification will make the links in your Monitor Events notification emails point back to the correct HTTPS URL.

**Note:** A future fix is planned.
